

WHAT IS CLAIMED:

1. A method for operating a user communication device, comprising the steps of:

5 providing a digital representation of an audible signal in each of a plurality of memory locations of a memory of the user communication device;

 receiving a call signal at the user communication device;

10 in response to receiving the call signal at the user communication device, selecting one of the plurality of memory locations; and

 generating the audible signal represented by the digital representation provided in the memory location
15 selected in the selecting step.

2. A method as set forth in Claim 1, wherein the user communication device comprises at least one of a telephone and a radiotelephone.

3. A method as set forth in Claim 1, wherein the
20 user communication device is coupled to a network having a

storage device, and the providing step comprises the steps
of:

receiving, at the user communication device, each
digital representation from the storage device; and

5 storing each received digital representation in a
respective one of the memory locations.

4. A method as set forth in Claim 1, wherein the
providing step comprises the steps of:

applying at least one audible signal to an input
10 of a user input-interface of the user communication device,
and outputting at least one corresponding analog signal
within the device;

in response to the inputting step, converting the
at least one analog signal to at least one corresponding
15 digital representation of that at least one audible signal;
and

storing the at least one digital representation in
the memory of the user communication device.

5. A method as set forth in Claim 1, further
20 comprising a step of determining at least one of a date and

a time at which the call signal is received in the user communication device, and wherein the step of selecting one of the plurality of memory locations is performed based on a result of the determining step.

5 6. A method as set forth in Claim 1, wherein the selecting step is performed by randomly selecting one of the plurality of memory locations.

10 7. A method as set forth in Claim 1, further comprising a step of operating an input-user interface of the user communication device to input information into the user communication device specifying that one of the plurality of memory locations be selected, and wherein the selecting step is performed by selecting the memory location specified by the inputted information.

15 8. A method as set forth in Claim 1, wherein the selecting step is performed based on predetermined information included in the received call signal.

20 9. A method as set forth in Claim 1, wherein the generating step is performed by generating the audible signal at predetermined time intervals.

10. A method as set forth in Claim 1, further

comprising the steps of:

determining at least one acoustic characteristic
of at least one of the audible signals, based on at least
one digital representation representing that at least one
5 audible signal;

comparing the at least one acoustic characteristic
determined in the determining step to at least one
predetermined acoustic characteristic; and

scaling the at least one digital representation
10 based on a result of the comparing step, to normalize the at
least one acoustic characteristic of the at least one
audible signal.

11. A method for operating a user communication
device, comprising the steps of:

15 providing a digital representation of an audible
signal, in a memory of the user communication device;

entering information through an interface of the
user communication device, specifying that a call be placed
from the user communication device to a destination
20 communication device; and

in response to the entering step, forwarding a call signal that includes the digital representation of the audible signal, towards the destination communication device, through an external interface.

5 12. A method as set forth in Claim 11, wherein the user communication device comprises at least one of a telephone and a radiotelephone.

13. A method as set forth in Claim 11, wherein the providing step comprises the steps of:

10 applying the audible signal to the interface of the user communication device, and producing a corresponding analog signal within the device;

 converting the analog signal to the digital representation; and

15 storing the digital representation in the memory of the user communication device.

14. A user communication device, comprising:

a memory including a plurality of memory locations, each storing a digital representation of a

corresponding audible signal;

a communication interface, coupled to an external interface, for receiving a call signal forwarded from a source communication device through the external interface;

5 an output-user interface having an input, said output-user interface for outputting an audible signal in response to an analog signal being applied to that input;

10 a converter having an input and an output, the output being coupled to the input of said output-user interface, said converter for converting digital information applied to the input thereof to a corresponding analog signal; and

15 a controller coupled to said memory, said communication interface, and the input of said converter, said controller being responsive to receiving the call signal from the communication interface for selecting one of the plurality of memory locations, and for applying the digital representation stored in the selected memory location to the input of said converter, to cause said
20 converter to output a corresponding analog signal to the input of said output-user interface, and thereby cause the

output-user interface to output the corresponding audible signal.

15. A user communication device as set forth in Claim 14, wherein said user communication device comprises
5 at least one of a telephone and a radiotelephone.

16. A user communication device as set forth in Claim 14, wherein said controller is in communication with at least one communication network through the external interface and said communication interface, the at least one
10 communication network has a storage device for storing each digital representation, and wherein said controller is responsive to receiving each individual digital representation from the storage device of the at least one network for storing that digital representation in said
15 memory.

17. A user communication device as set forth in Claim 14, further comprising:

an input interface having an input, and also having an output coupled to said controller, said input
20 interface being responsive to each individual audible signal being applied to that input for outputting a corresponding

analog signal in said user communication device; and

a further converter interposed between an output of said input interface and an input of said controller, said further converter being responsive to receiving each individual analog signal for producing the corresponding digital representation, and wherein said controller is responsive to each individual produced digital representation for storing the produced digital representation in said memory.

18. A user communication device as set forth in Claim 14, wherein said controller selects one of the plurality of memory locations based on predetermined information included in the call signal.

19. A user communication device as set forth in Claim 14, wherein said controller is responsive to the call signal being received for determining at least one of a date and a time at which the call signal is received in the user communication device, and selects one of the plurality of memory locations based on the determined at least one of the date and time.

20. A user communication device as set forth in

Claim 14, wherein said controller selects one of the plurality of memory locations at random.

21. A user communication device as set forth in Claim 14, wherein said user communication device further comprises an input user interface for inputting, into said controller, information specifying that one of the plurality of memory locations be selected, and said controller is responsive to the call signal being received for selecting the memory location specified by the information inputted through said input user interface.

22. A user communication device as set forth in Claim 14, wherein said controller applies the retrieved digital representation to the input of said converter at predetermined time intervals, to cause the audible signal to be output at those predetermined time intervals.

23. A user communication device as set forth in Claim 14, wherein said controller is operable for (a) determining at least one acoustic characteristic of at least one of the audible signals, based on the corresponding digital representation provided in said memory, (b) comparing the at least one acoustic characteristic to at least one predetermined acoustic characteristic, and (c)

scaling the corresponding digital representation based on a result of the comparison, to normalize the at least one acoustic characteristic.

24. A user communication device, comprising:

5 a memory storing a digital representation of an audible signal;

a communication interface coupled to an external interface;

an input-user interface; and

10 a controller coupled to said memory, said communication interface, and said input-user interface, said controller being responsive to receiving from said input-user interface information specifying that a call be placed to a destination communication device for retrieving the
15 digital representation from said memory and forwarding a call signal that includes the retrieved digital representation through said communication interface towards the destination communication device.

25. A user communication device as set forth in
20 Claim 24, wherein the user communication device comprises at

least one of a telephone and a radiotelephone.

26. A user communication device as set forth in Claim 24, further comprising:

a further input-user interface having an input,
5 and also having an output coupled to said controller, said further input-user interface being responsive to the audible signal being applied to that input for outputting a corresponding analog signal in said device;

a converter interposed between said further input-
10 user interface and said controller, said converter for converting the analog signal to the digital representation, and wherein said controller is responsive to receiving the digital representation from said converter for storing the digital representation in said memory.

15 27. A program product which comprises program code for executing a method for operating a user communication device, the method comprising the steps of:

providing a digital representation of an audible
signal in each of a plurality of memory locations of a
20 memory of the user communication device;

receiving a call signal at the user communication
device;

in response to receiving the call signal at the
user communication device, selecting one of the plurality of
5 memory locations; and

generating the audible signal represented by the
digital representation provided in the memory location
selected in the selecting step.

28. A program product as set forth in Claim 27,
10 wherein the user communication device is in communication
with a network having a storage device, and the providing
step comprises the steps of:

receiving, at the user communication device, each
digital representation from the storage device; and

15 storing each received digital representation in a
respective one of the memory locations.

29. A program product as set forth in Claim 27,
wherein the providing step comprises the steps of:

producing analog signals within the user
20 communication device in response to audible signals being

applied to an input of a user input-interface of the device,
the analog signals representing the audible signals;

in response to the analog signals being produced,
converting the analog signals to corresponding digital

5 representations; and

storing the digital representations in respective
ones of the memory locations of the memory.

30. A program product as set forth in Claim 27,
wherein the step of selecting one of the plurality of memory
10 locations is performed based on predetermined information
included in the received call signal.

31. A program product as set forth in Claim 27,
further comprising a step of determining at least one of a
date and a time at which the call signal is received in the
15 user communication device, and wherein the step of selecting
one of the plurality of memory locations is performed based
on a result of the determining step.

32. A program product as set forth in Claim 27,
wherein the selecting step is performed by randomly
20 selecting one of the plurality of memory locations.

33. A program product as set forth in Claim 27,
further comprising a step of entering, through an input-user
interface of the user communication device, information
specifying that one of the plurality of memory locations be
5 selected, and wherein the selecting step is performed by
selecting the memory location specified by the inputted
information.

34. A program product as set forth in Claim 27,
wherein the generating step is performed by generating the
audible signal at predetermined time intervals.
10

35. A program product as set forth in Claim 27,
wherein the method further comprises the steps of:

determining at least one acoustic characteristic
of at least one of the audible signals, based on at least
15 one of the provided digital representations;

comparing the at least one acoustic characteristic
determined in the determining step to at least one
predetermined acoustic characteristic; and

scaling the at least one digital representation
20 based on a result of the comparing step, to normalize the at
least one acoustic characteristic of the at least one

audible signal.

36. A program product comprising program code for executing a method for operating a user communication device, the method comprising the steps of:

5 providing a digital representation of an audible signal, in a memory of the user communication device;

 entering information through an interface of the user communication device, specifying that a call be placed from the user communication device to a destination
10 communication device; and

 in response to the entering step, forwarding a call signal that includes the digital representation towards the destination communication device, through an external interface.

15 37. A program product as set forth in Claim 36, wherein the providing step comprises the steps of:

 generating an analog signal in the user communication device in response to the audible signal being applied to the interface, the analog signal representing the
20 audible signal;

converting the analog signal to the digital
representation of the audible signal; and

storing the digital representation in the memory
of the user communication device.

5 38. A method for operating a communication system
that comprises a plurality of user communication devices,
the method comprising the steps of:

10 providing a digital representation of an audible
signal in each of a plurality of memory locations of a
memory of a first one of the plurality of user communication
devices;

 forwarding a call signal from a second one of the
user communication devices towards the first user
communication device; and

15 in response to the call signal being received at
the first user communication device, selecting one of the
plurality of memory locations; and

 generating the audible signal represented by the
digital representation provided in the memory location
20 selected in the selecting step.

39. A method as set forth in Claim 38, wherein each of the user communication devices comprises one of a telephone, a radiotelephone, and an information appliance.

40. A method as set forth in Claim 38, wherein
5 the providing step comprises the steps of:

applying audible signals to an input of a user input-interface of the first user communication device, and producing corresponding analog signals in that device;

10 in response to the inputting step, converting each individual analog signal to a corresponding one of the digital representations; and

storing each individual digital representation in a respective one of the memory locations of the memory of the first user communication device.

15 41. A method as set forth in Claim 38, wherein the step of selecting one of the plurality of memory locations is performed based on predetermined information included in the received call signal.

20 42. A method as set forth in Claim 38, further comprising the step of determining at least one of a date

and a time at which the call signal is received at the first user communication device, and wherein the step of selecting one of the plurality of memory locations is performed based on a result of the determining step.

5 43. A method as set forth in Claim 38, wherein the selecting step is performed by randomly selecting one of the plurality of memory locations.

10 44. A method as set forth in Claim 38, further comprising a step of operating an input-user interface of the first user communication device to input information into that device specifying that one of the plurality of memory locations be selected, and wherein the selecting step is performed by selecting the memory location specified by the inputted information.

15 45. A method as set forth in Claim 38, wherein the generating step is performed by generating the audible signal at predetermined time intervals.

20 46. A method as set forth in Claim 38, wherein the providing step includes a step of downloading each digital representation from the Internet, and into the memory of the first user communication device.

47. A method as set forth in Claim 38, wherein
the communication system also comprises at least one
communication network having a storage device storing each
digital representation, the first and second user
5 communication devices are communicatively coupled to the at
least one communication network, and the providing step
comprises the steps of:

providing each digital representation from the
storage device of the at least one communication network to
10 the first user communication device; and

storing each digital representations provided to
the first user communication device in a respective one of
the memory locations of the memory of the first user
communication device.

48. A method as set forth in Claim 47, wherein
the plurality of user communication devices are
communicatively coupled to the at least one communication
network, and wherein the method further comprises the steps
of:

20 providing each digital representation in a memory
of one of the user communication devices besides the first

user communication device;

communicating each digital representation from the memory of the one user communication device to the at least one network; and

5 storing each digital representation in the storage device of the at least one network, prior to providing each digital representation from the storage device to the first user communication device.

49. A method as set forth in Claim 48, further
10 comprising the step of communicating a request for each digital representation from one of the first and second user communication devices to the at least one communication network, and wherein the step of providing each digital representation from the storage device to the first user
15 communication device is performed in response to the request being received in the at least one communication network.

50. A method as set forth in Claim 49, wherein the step of communicating the request is performed a plurality of times at respective predetermined time
20 intervals.

51. A method as set forth in Claim 50, wherein

the storage device includes a plurality of memory locations, each storing a respective digital representation of a corresponding audible signal, and wherein the providing step comprises the steps of:

5 selecting at least one of the plurality of memory locations of the storage device; and

 storing the digital representation from the at least one memory location selected in that selecting step to the memory of the first user communication device.

10 52. A method as set forth in Claim 51, further comprising the step of communicating information specifying that the at least one memory location of the storage device be selected, from the first user communication device to the at least one communication network, and wherein the step of
15 selecting the at least one memory location of the storage device is performed in response to that information being received in the at least one communication network.

 53. A method for operating a communication system comprising a plurality of user communication devices, the
20 method comprising the steps of:

 initiating a call at a first one of the user

communication devices, for being placed to a second one of
the user communication devices;

inserting a digital representation of an audible
signal into a call signal used for placing the call;

5 forwarding the call signal towards the second user
communication device; and

in response to receiving the call signal at the
second user communication device, generating the audible
signal based on the digital representation included in the
10 call signal.

54. A method as set forth in Claim 53, wherein
each of the user communication devices comprises one of a
telephone, a radiotelephone, and a user information
appliance.

15 55. A method as set forth in Claim 53, further
comprising the steps of:

applying the audible signal to an input of a user
interface of the first user communication device, and
generating a corresponding analog signal in the first user
20 communication device; and

converting the analog signal to the digital
representation,

wherein the inserting step is performed by
inserting that digital representation in the call signal,
5 within the user communication device.

56. A method as set forth in Claim 55, further
comprising the steps of:

determining at least one acoustic characteristic
of the audible signal, based on the digital representation;

10 comparing the at least one acoustic characteristic
determined in the determining step to at least one
predetermined acoustic characteristic; and

scaling the digital representation based on a
result of the comparing step, to normalize the at least one
15 acoustic characteristic of the audible signal.

57. A method as set forth in Claim 53, wherein
the call signal includes predetermined information, and
further comprising the step of determining whether the
predetermined information included in the call signal
20 corresponds to information stored in a memory of the second

user communication device, in response to the call signal
being received at the second user communication device, and
wherein the generating step is performed in response to
determining that the predetermined information does
5 correspond to the information stored in the memory of the
second user communication device.

58. A method as set forth in Claim 53, wherein
the communication system also comprises at least one
communication network having a storage device storing the
10 digital representation of the audible signal, the first and
second user communication devices are communicatively
coupled to the at least one communication network, and the
method further comprises the steps of:

prior to the inserting step, transmitting the call
15 signal from the first user communication device, through at
least a portion of the at least one communication network;
and

in response to the call signal being received in
the at least one communication network, retrieving the
20 digital representation from the storage device,

wherein the inserting step is performed by

inserting the digital representation retrieved from the
storage device in the call signal.

59. A method as set forth in Claim 58, wherein
the at least one communication network includes at least a
5 portion of the Internet.

60. A communication system, comprising:

a first user communication device comprising a
first communication interface coupled to an external
interface, and a controller coupled to the first
10 communication interface, the controller being operable for
forwarding a call signal through the first communication
interface; and

a second user communication device comprising a
memory, a second communication interface coupled to the
15 external interface, and an audible signal generator portion
coupled to the memory and the second communication
interface, wherein the memory has a plurality of memory
locations, each of which stores a digital representation of
a corresponding audible signal, and the audible signal
20 generator portion is responsive to the call signal being
received from the first user communication device through

the second communication interface for selecting one of the memory locations and for generating the audible signal represented by the digital representation stored in the selected memory location.

5 61. A communication system as set forth in Claim 60, wherein each of the first and second user communication devices comprises one of a telephone, a radiotelephone, and an information appliance.

10 62. A communication system as set forth in Claim 60, wherein the audible signal generator portion selects one of the memory locations based on predetermined information included in the received call signal.

15 63. A communication system as set forth in Claim 60, wherein the audible signal generator portion is responsive to the call signal being received for determining at least one of a date and a time at which the call signal is received, and selects one of the plurality of memory locations based on a result of that determination.

20 64. A communication system as set forth in Claim 60, wherein the audible signal generator portion randomly selects one of the plurality of memory locations.

65. A communication system as set forth in Claim 60, wherein said second user communication device further comprises an input-user interface coupled to the audible signal generator portion, for inputting information into that device specifying that one of the plurality of memory locations be selected, and wherein the audible signal generator portion is responsive to the call signal being received for selecting the memory location specified by that inputted information.

66. A communication system as set forth in Claim 60, wherein the communication system also comprises at least one communication network coupled to the first and second user communication devices through the respective first and second communication interfaces, said at least one communication network comprises a message station and a storage device storing the digital representations of the audible signals, wherein at least one of the controller of said first user communication device and the audible signal generator portion of said second user communication device is operable for communicating a download request to the at least one network, and wherein the message station is responsive to receiving the download request for providing

the digital representations from the storage device to the second communication interface of the second user communication device, and wherein the audible signal generator portion of said second user communication device is responsive to receiving the digital representations from the second communication interface for storing the digital representations in respective ones of the memory locations in the memory.

67. A communication system as set forth in Claim 66, wherein the at least one of the controller and the audible signal generator portion communicates the download request a plurality of times at respective predetermined time intervals.

68. A communication system, comprising:

a first user communication device comprising a first communication interface, a memory, an input user interface, and a controller coupled to the first communication interface, the memory, and the input user interface, the memory storing a digital version of an audible signal, the controller being responsive to receiving from the input user interface information specifying that a call be placed from the first user communication device for

forwarding a call signal that includes the digital
representation from the memory through an external interface
coupled to the first communication interface; and

a second user communication device comprising a
5 second communication interface coupled to the external
interface, and an audible signal generator portion coupled
to the second communication interface, wherein the audible
signal generator portion is responsive to receiving the call
signal from the second communication interface for
10 generating the audible signal based on the digital
representation included in the call signal.

69. A communication system as set forth in Claim
68, wherein each of the first and second user communication
devices comprises one of a telephone, a radiotelephone, and
15 a user information appliance.

70. A communication system as set forth in Claim
68, wherein the call signal includes predetermined
information, the second user communication device also
comprises a memory, and the audible signal generator portion
20 is responsive to receiving the call signal for determining
whether the predetermined information included in the call
signal corresponds to information stored in the memory of

the second user communication device, and generates the
audible signal in response to determining that the
predetermined information does correspond to the information
stored in the memory of the second user communication
5 device.

71. A communication system, comprising:

a first user communication device, comprising a
first communication interface, an input user interface, and
a controller coupled to the first communication interface
10 and the input user interface, the controller being
responsive to receiving from the input user interface
information specifying that a call be placed from the first
user communication device, for forwarding a call signal
through the first communication interface;

15 at least one communication network, having a
second communication interface coupled to the first
communication interface of said first user communication
device, and also having a third communication interface,
said at least one communication network comprising a message
20 station and a storage device coupled to the message station,
wherein the storage device stores a digital representation
of at least one audible signal, and the message station is

responsive to receiving the call signal for (a) retrieving
the digital representation from the storage device, (b)
inserting the retrieved digital representation in the call
signal, and (c) forwarding the call signal through the third
5 communication interface; and

a second user communication device comprising a
fourth communication interface coupled to the third
communication interface of the at least one communication
network, and also comprising an audible signal generator
10 portion coupled to the fourth communication interface,
wherein the audible signal generator portion is response to
receiving the call signal for generating the audible signal
based on the digital representation included in the call
signal.

15 72. A communication system as set forth in Claim
71, wherein the at least one communication network includes
at least a portion of the Internet.

73. A method for operating a user communication
device, comprising the steps of:

20 operating an interface of the communication device
to enter into the device at least one identifier identifying

at least one respective calling source from which a call
signal may be received;

operating the interface to enter into the user
communication device at least one signal representing at
5 least one corresponding user-perceptible alerting signal
that is to be generated in response to a call being received
from the at least one respective calling source; and

storing in a memory of the user communication
device, the at least one identifier in association with the
10 at least one signal.

74. A method as set forth in Claim 73, wherein
the user-perceptible alerting signal includes an audible
signal.

75. A method as set forth in Claim 73, further
15 comprising a step of normalizing the entered at least one
signal in accordance with predetermined criteria.

76. A method as set forth in Claim 73, wherein
the at least one identifier comprises at least one of a
telephone number, a pager number, an IP address, a domain
20 name, and a public key certificate.

77. A method for operating a user communication device, comprising the steps of:

at the user communication device, receiving an incoming call signal from a calling source, the call signal including both an identifier which identifies the calling source, and information representing a user-perceptible alerting signal;

comparing the identifier included in the call signal with a plurality of identifiers stored in a memory of the user communication device to determine whether any of the compared identifiers correspond with one another; and

if it is determined that the identifier included in the call signal corresponds to any of the identifiers stored in the memory, generating the user-perceptible alerting signal represented by the information included in the call signal.

78. A method as set forth in Claim 77, wherein if it is determined that the identifier included in the received call signal does not correspond to any of the identifiers stored in the memory, a step is performed of generating a different user-perceptible alerting signal.

79. A method as set forth in Claim 77, wherein
user-perceptible alerting signal includes an audible signal.

80. A user communication device, comprising:

a memory;

5 an interface; and

a controller coupled to said memory and said
interface, said controller being responsive to receiving
from said interface (a) at least one identifier identifying
at least one respective calling source from which a call
10 signal may be received, and (b) at least one signal
representing at least one respective user-perceptible
alerting signal that is to be generated in response to a
call signal being received from the at least one respective
calling source, for storing the entered at least one signal
15 in association with the at least one identifier in said
memory.

81. A user communication device, comprising:

a communication interface for receiving an
incoming call signal from a calling source, the call signal
20 including both an identifier which identifies the calling

source and information representing a user-perceptible
alerting signal;

an output user-interface;

a memory storing a plurality of identifiers

5 identifying calling sources from which call signals may be
received; and

a controller coupled to said communication
interface, said output user-interface, and said memory, said
controller being responsive to receiving the call signal
10 from said communication interface for comparing the
identifier included in the call signal with the plurality of
identifiers stored in said memory to determine whether any
of the compared identifiers correspond to one another, and,
if it is determined that the identifier included in the call
15 signal corresponds to any of the identifiers stored in the
memory, for controlling said output user-interface for
causing that output user-interface to generate the user-
perceptible alerting signal represented by the information
included in the call signal.

20 82. A user communication device as set forth in
Claim 81, wherein said controller is responsive to

determining that the identifier included in the received
call signal does not correspond to any of the identifiers
stored in the memory, for controlling said output user-
interface to cause that output interface to generate a
5 different user-perceptible alerting signal.

83. A user communication device as set forth in
Claim 81, wherein the output user-interface includes a
speaker, and the user-perceptible alerting signal includes
an audible signal.

10 84. A communication system, comprising:

a first user communication device comprising first
communication interface means coupled to an external
interface, and control means operable for forwarding a call
signal through the first communication interface means; and

15 a second user communication device comprising
storage means, second communication interface means coupled
to the external interface, and alerting signal generator
means coupled to the storage means and the second
communication interface means, wherein the storage means
20 includes a plurality of memory locations, each of which
stores a digital representation of a corresponding user-

perceptible signal, and the alerting signal generator means is responsive to the call signal being received through the second communication interface means for selecting one of the memory locations and for generating the user-perceptible alerting signal represented by the digital representation stored in the selected one of the memory locations.

85. A user communication device, comprising:

storage means;

input means for inputting (a) identifiers identifying respective ones of a plurality of calling sources from which call signals may be received, and (b) signals representing respective ones of a plurality of user-perceptible alerting signals that are to be individually generated in response to calls being received from respective ones of the calling sources; and

control means coupled to said storage means and said input means, said controller being responsive to receiving from said input means at least one of the identifiers and at least one corresponding signal for storing the at least one signal in association with the at least one identifier in said storage means.

86. A user communication device, comprising:

communication interface means for receiving an incoming call signal from a calling source, the call signal including both an identifier which identifies the calling
5 source and information representing a user-perceptible alerting signal;

output user-interface means;

a storage means storing a plurality of identifiers identifying calling sources from which call signals may be
10 received; and

control means coupled to said communication interface means, said output user-interface means, and said storage means, said control means being responsive to receiving the call signal from said communication interface
15 means for comparing the identifier included in the call signal with the plurality of identifiers stored in said storage means to determine whether any of the compared identifiers correspond to one another, and, if it is
20 determined that the identifier included in the call signal corresponds to any of the identifiers stored in the storage means, for controlling said output user-interface means to

cause that output user-interface means to generate the user-perceptible alerting signal represented by the information included in the call signal.

87. A user communication device as set forth in
5 Claim 86, wherein the output user-interface means includes a speaker, and the user-perceptible alerting signal includes an audible signal.

88. A method for operating a user communication device, comprising the steps of:

10 providing a plurality of categories of identifiers in a memory of the user communication device, each identifier identifying a calling source from which a call may be received;

15 providing a plurality of digital representations of corresponding user-perceptible alerting signals, in the memory of the user communication device, each digital representation corresponding to a particular one of the categories of identifiers;

20 receiving a call signal from one of the calling sources, the call signal including an identifier from one of

the categories of identifiers; and

in response to receiving the call signal,
generating the user-perceptible alerting signal represented
by the digital representation corresponding to that category
5 of identifiers.

ABSTRACT

A method for operating a user communication device (18a, 18b, 19a, 19b), and a program and user communication device that operate in accordance with that method. An interface (2d, 2b, 23, 22) of the communication device (18a, 18b, 19a, 19b) is operated to enter identifiers identifying respective calling sources (18a, 18b, 19a, 19b) from which call signals may be received. The interface also is operated for entering into the device (18a, 18b, 19a, 19b) electrical signals representing corresponding audible signals that are to be individually generated in response to calls being received from the respective calling sources (18a, 18b, 19a, 19b). The identifiers are stored in a memory (2c, 24) in association with respective ones of the electrical signals. Accordingly, when a call signal is later received from one of the calling sources, an identifier included in the signal is correlated to a corresponding stored identifier and to a corresponding stored electrical signal, and the audible signal represented by that electrical signal is then generated to indicate the receipt of the call from the calling source.
